

What is FeaturePlus?

FeaturePlus is a hosted telephony solution designed for small and home offices, but it is equally useful for large corporate clients with geographically diverse or mobile workers. The service can either be provided via a FeaturePlus IP phone or a FeaturePlus adaptor connected to any standard analogue phone.

FeaturePlus works across a standard broadband connection and provides an Internet based phone with a fixed landline number that is both portable and unrestricted by geographic location.

The benefits of FeaturePlus

With FeaturePlus a mobile employee working between London and Edinburgh can maintain their London 0208 number regardless of their location. No configuration or setup is required, just plug your phone into any broadband connection and it will connect with your number. You then control your telephony services via an online portal. With features such as call forwarding to mobile, call transfer and voicemail to email, you can be sure that you'll never miss a call – no matter where you are.

Calls are routed over a broadband connection from Network One, so you will benefit from our low cost broadband charges. Couple this with FREE FeaturePlus-to-FeaturePlus calls (site -to-site) and reduced line rental and will see a significant reduction in your monthly phone bills.

How does it work?

The necessary hardware comes pre-configured and is delivered and ready to use in days.

The 'On Screen' web interface opens up a brand new world where you, the user, are in control of what happens to your telephone calls - be it handling inbound calls or managing how calls are made.

Who is it aimed at?

The service is ideal for multi-site organisations with branch offices (up to 7 extensions) or businesses with home/remote workers. Users can take advantage of remote user management (including moves, adds and changes), a unified short-code dial plan for all users and zero-rated FeaturePlus-to-FeaturePlus calls (site-to-site).
